PR 17: TriNertia Releases New Family of Axial Fans Available Oct 2009

Santa Ana CA - TriNertia is proud to announce another new product family for 2009. Consisting of 140 axial fans, the new part numbers are available in either round or square bodies. Some models are all metal while others use plastics for lighter weight.

Axial fans have a narrow depth which makes them ideal for tight spaces where airflow is more important than pressure. They are excellent for electronics cooling and cabin / crew ventilation. "We are excited to be introducing our third new TriNertia fan and blower product family in such a short time" noted John Anderson V.P. and General Manager. Prior introductions included line fans and centrifugal blowers. This brings the total number of TriNertia fans and blower available to over 500 part numbers.

These axial fans come in multiple sizes and voltages. TriNertia fans are U/L certified and many also have TUV and CE certification available. Axial fans have many industrial and defense ground vehicle applications including:

- Crew and cabin ventilation
- Electronics cooling and heating
- Window and instrument defrosting
- Field Shelters and building exhaust

Specifications are available on line at TriNertia.com or through your local distributor.
